PULL or LIFT PETROL POWERED CAPSTAN WINCH

Powered by a Honda 2.5hp 4 stroke motor, the **Pulling** version will haul up to 1136kg on the standard 57mm capstan. The line speed will vary between 7.6 metres and 12 metres per minute depending on the weight of the load.

There is the option to exchange the 57mm capstan with a 85mm capstan which will increase the line speed to between 11 metres and 18 metres per minute depending on the weight of the load. **Note the pulling capacity drops to 614kg's when the 85mm capstan is used.**

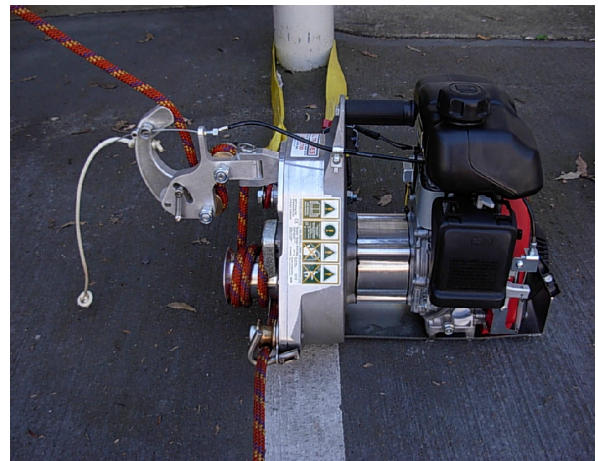

Lightweight at 15 or 19kg depending on the model, the unit will work at approx 4 times the speed of an electric winch. Standard anchor accessories are a towball adaptor, Hayman Reese adaptor, or a pole mounted adaptor.

The **Lifting** version winch is fitted with a centrifugal clutch and spring loaded brake attachment which will allow you to safely lift loads up to 450kg. (**to be used with 57mm capstan only**)

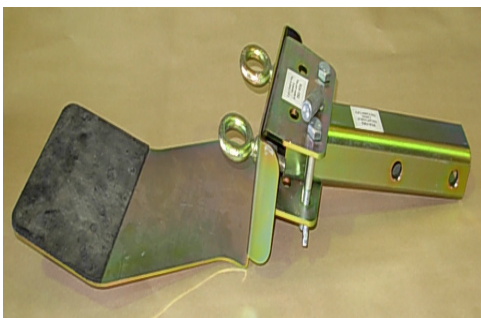

After trialling various types of rope we have found that 11mm braided response rope performed the best, (pictured in photograph below.) This rope is normally supplied on a 200m coil as standard however custom lengths and splicing services are available on request.
