240V Electric Conduit Blower

Our 240V Conduit Blower unit is ideal when site power is available or you have access to a generator (we recommend 3.3kva or larger, earth leakage protection to your generator or power lead is also recommended)

Standard accessories include a 5 metre length of 50mm diameter air hose complete with Camlock fittings, and a "Y" piece conduit seal adaptor. Conduit seal off's ranging from 20mm - 200mm. are available and are conical shaped in order to fit various conduit sizes. The electric motor and housing weighs 12kg

The distances obtainable with this unit will vary from job to job depending on circumstances such as conduit integrity, bends, conduit diameter, hills etc. Our field visits and trials have revealed that 3mm drawline can blow a distance of 600m through a clean 150mm conduit very effectively and in quick time, indicating that a distance of 1000m+ would be obtainable in most circumstances. Parramatta rope is rolled to either 400m or 500m coils and the unit would deliver to that distance in well prepared conduits.

We recommend that you first blow the conduit for a minimum of 30 seconds without a drawline in order to discharge any debris/water etc.
