User Tips; 22MM X 3M SECTIONAL HAND ROD.

Order Code; VAN-HR

- Ensure both male and female threaded sections are clean and free of any debris that may prevent the sections from joining securely or thread stripping.
- Wrap duct tape around each joint as you feed the rods down the conduit. This may sound time consuming but it may help you retrieve the rods in the event of a jam or thread separation.
- If blockages are encountered take care not to force the rod/s through as it may be impossible for them to pass. They are not designed to clear stubborn blockages inside conduits.
- When using always twist the rods in a clockwise direction to prevent the sections from unscrewing. For long runs or difficult conditions you should use a crank handle to aid in leverage.
- Accessories available include hook and loop sets for inline joining, crank handles, a removable hauling eye, and sand scoop.

**Note: HAND RODS and accessories are covered under a 12 month warranty for manufacturing defect only.**
