DRAWLINE BLOWING GUN

Our drawline blowing gun is suitable for use with drawline or rope ranging in size from 3mm through to 8mm. At the rear of the blowing gun is an adaptor, which is selected depending on the size of your drawline/rope. When purchasing your gun the supplied grommet will be 6mm, which will accommodate Parramatta rope as well as the smaller lines. In the event that you only ever use the one size drawline or rope, you can order the corresponding grommet size accordingly.

Your drawline/rope enters through the grommet and exits through the hollow tube section of the drawline gun. At this point your selected drawline carrier is fitted.

The conduit seals are fitted by removing the front locking nut and placing your seal over the threaded shaft of the gun. When you tighten the lock nut over your selected conduit seal you then tighten the wing nut in order to depress the rubber conduit seal to provide a snug fit. **This can be done with the conduit seal already in the conduit opening so long as your drawline and line carrier have been inserted.**

The drawline blowing gun is fitted with a universal air hose fitting and single action toggle type handle for easy on/off switching.

We recommend that you first blow any debris/water out before attempting to rope the conduit.

Drawline (3mm) is normally supplied on 1000m spools; 6mm Parramatta rope is available in 400 or 500metre coils.

Standard conduit seals range in size from 50mm through to 150mm.
